

1 2 5 w a s h

The need for a continuous fully integrated Washlite fixture has often been a requirement of lighting designers. As a result KLIK has developed the 125 Wash system.

The luminaire offers the designer the ability to use the fixture in a number of orientations, from the washing of walls, floors & ceilings to the illumination of stairs and other areas.

Using LightStream Technology, the 125 Wash has been designed to eliminate dark zones caused by shadowing of the

lamp ends and lampholders, which until now has always been difficult to overcome.

125 Wash utilises the latest lamp technology offering T5 in either dimmable 1-10V or DSI or non-dimmable control gear.

The system can also incorporate the latest colour changing technology for those areas requiring more sophisticated lighting effects and can also incorporate LEDs.

125 Wash is supplied in maximum lengths of up to 5m in extruded aluminium and

is coupled together on site with internal fixings (blind couplers).

Only the aperture of the fixture is visible once installed, as the luminaire has been designed to sit behind either the wall or inside the ceiling with the plasterboard/ gypsum wall being sheeted after the fixture is installed.

Due to the complexity of individual site conditions we prefer our in-house design team to work closely with the designer offering technical assistance and advice. We welcome your project enquiries.
